

1. Names: Ace Brown and Paul Kwiatkowski
 - a. ctj55 and evl31
 - b. CS4318
2. Paul Kwiatkowski worked on the symbol table side of the project. That included implementing the hierarchical scope structure in strtab.c, handling symbol insertion and lookup, storing function parameters, and keeping the global scope behavior consistent. Paul also added the extra-credit AST minimization so wrapper nodes are collapsed before the AST is printed.

Ace Brown worked on the semantic analysis in parser.y. That included checking for undeclared identifiers, multiply declared identifiers, validating function calls against their signatures, checking array indexing rules, and tightening assignment type checking so the right expression types are compared correctly.

3. Test cases:

Test 1:

Input:

```
int main(){
    int nums[3];
    int i;
    char c;
    i = c;
    i[1];
}
```

Output:

error: line 5: Type mismatch in assignment
error: line 6: Non-array identifier used as an array.
Compilation finished.

Test 2:

Input:

```
int takesArr(char a[]){
    return 0;
}
```

```
int main(){
    int x;
    char s[4];
    takesArr(x);
    takesArr(s, x);
}
```

}

Output:

error: line 8: Argument type mismatch in function call.

error: line 9: Number of arguments does not match function definition

4. No extra compilation instructions needed.
